

Synthetic Biology

Risks, rewards, and opportunities

Andrew Hessel

ahessel@gmail.com

Cross Cancer Institute, October 23 2007

Synthetic biology is a basket of technologies that facilitate the engineering of living organisms

**Potentially the single most important
technology of this century...**

microelectronics group

Lucent Technologies
Bell Labs Innovations

A replica of the first transistor,
invented at Bell Labs,
December 23, 1947

50 Years and Counting...

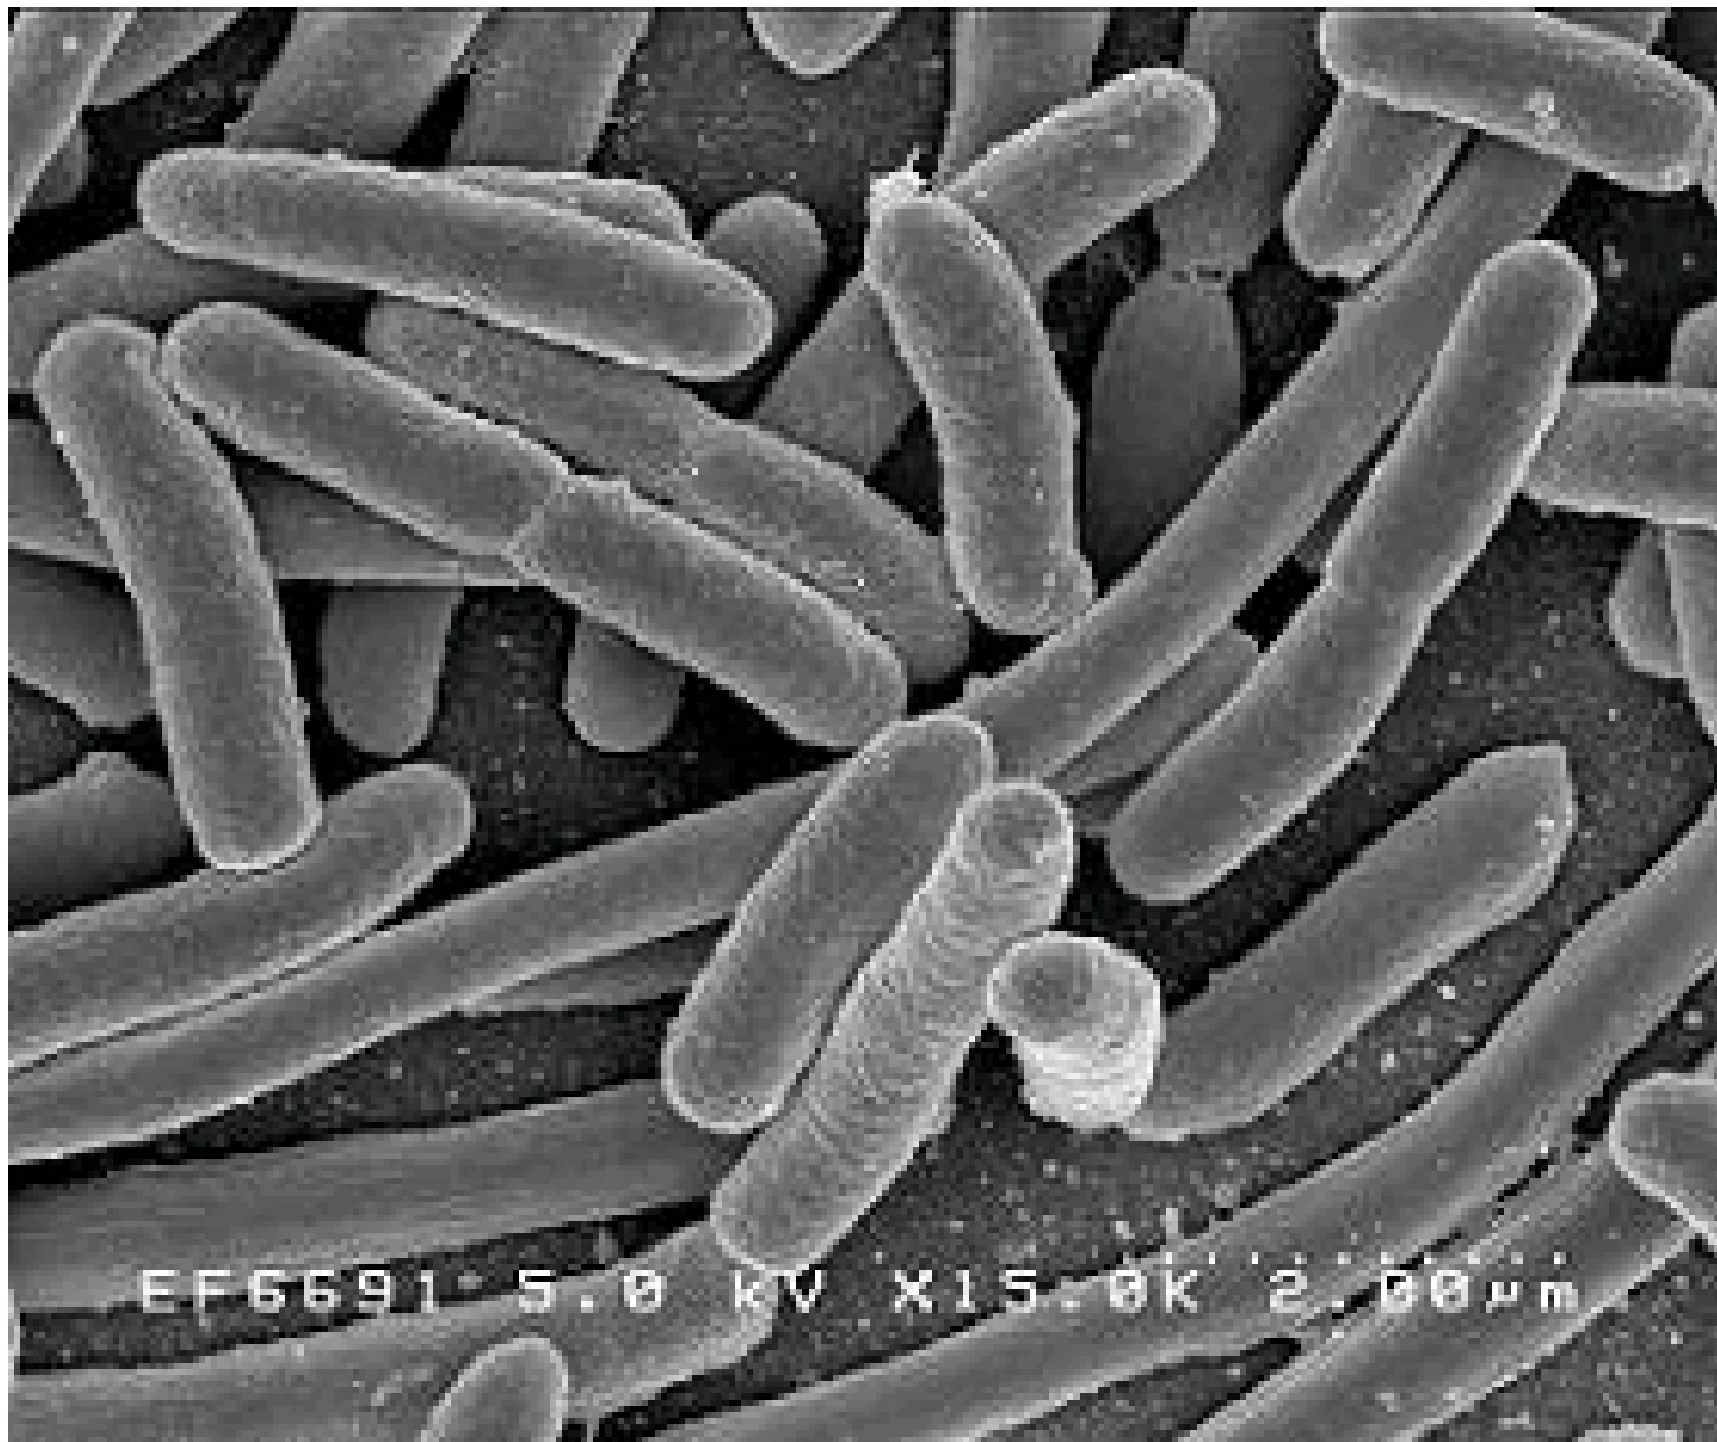

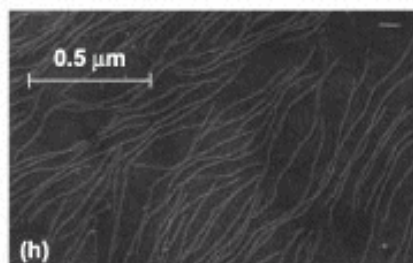

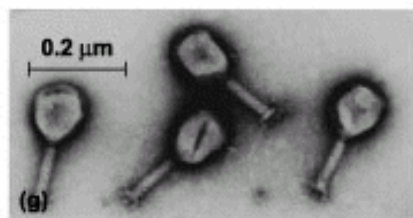

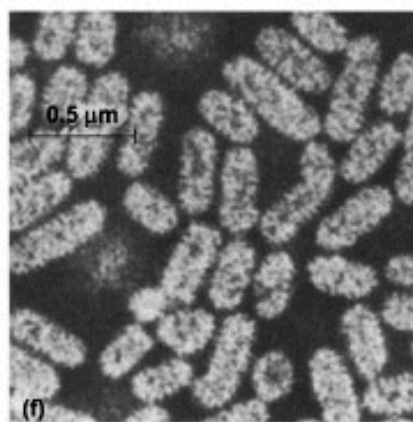

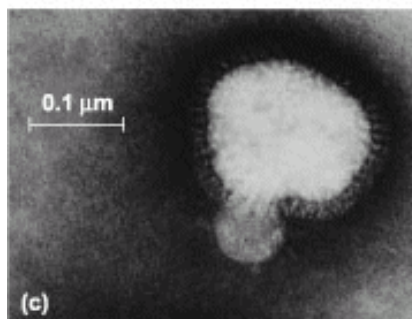

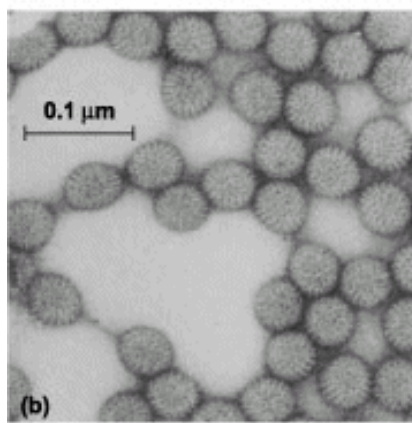

Bits (0s,1s) encode information for digital electronic processors (computers)

DNA encodes information for analog biochemical processors (cells)

DNA is source code for biological systems

Change the code, change metabolism

Genomes are special programs that encode:

- Instructions for biochemical processors
- Machinery to duplicate the processor and install the program onto processors

Equivalent in computing not to an operating system but to all the software it would take to run a production line at Apple or Dell Inc.

BBa_F2620

3OC₆HSL → PoPS Receiver

http://parts.mit.edu/registry/index.php/Part:BBa_F2620

Authors:
Barry Canton [bcanton@mit.edu]
Anna Labno [alabnoa@mit.edu]

Last Update: 15 January 2007

Description

A transcription factor (LuxR, BBa_C0062) that is active in the presence of cell-cell signaling molecule 3OC₆HSL is controlled by a TetR-regulated operator (BBa_R0040). Device Input is 3OC₆HSL. Device output is PoPS from a LuxR-regulated operator. If used in a cell containing TetR then a second input signal such as aTc can be used to produce a Boolean AND function.

Characteristics

Input Swing: 1E-9 to 1E-6 M 3OC₆HSL, exogenous
Output Swing: 0±1 to 503±1 GFP molecules cfr⁻¹ s⁻¹
Switch Point: 7±1 nM 3OC₆HSL, exogenous
LH Response: 9 min (t_{50%}), 27 min (t_{90%})

Key Parts

BBa_R0040: TetR-regulated operator
BBa_C0062: luxR ORF
BBa_R0002: LuxR-regulated operator

Demand (low/high input)

Translational: 256/8048 ribosomes cfr⁻¹
3.8E3/1.2E5 charged tRNA cfr⁻¹ s⁻¹

Compatibility

Chassis: Compatible with MC4100, MG1655, and DHSα
Plasmids: Compatible with pSB3K3 and pSB1A2
Devices: Compatible with E0240, E0430 and E0434
Crosstalk with systems containing TetR (C0040)
Signaling: Crosstalk with input molecules similar to 3OC₆HSL

Stability (low/high input)

Genetic: >92/74 replication events**
Performance: >92/74 replication events**
Conditions (abridged)
Output: Indirect via BBa_E0240
Vector: pSB3K3
Chassis: MG1655
Culture: Supplemented M9, 37°C
***Equipment:** PE Victor3 plate reader
****Equipment:** BD FACScan cytometer

Designs on life

Earlier this month, students from around the world locked horns in competition. Their challenge was to build functioning devices out of biological parts. Erika Check finds out how they got on.

Even if you're thinking big, you usually have to start small. Especially, as a group of Swiss students found, when big means counting to infinity. The team was drawing up a blueprint for the world's first counting machine made entirely of biological parts. Although they had their sights on lofty numbers, they opted to go no higher than two. If the plan worked, it would be a proof-of-principle for a much larger tallying device.

The group, from the Federal Institute of Technology (ETH) in Zurich, was one of 17 teams unveiling their projects at the first international Intercollegiate Genetically Engineered Machine (iGEM) competition, held at the Massachusetts Institute of Technology (MIT) in Cambridge on 5 and 6 November. The event attracted students from all over the world to design and build machines made entirely from biological components such as genes and proteins. They drew up grand designs for bacterial E. coli, bacteriophages, plasmids, ribosomes, and sensors. And if none of the designs succeeded completely, that was more because of the limitations of the nascent science of synthetic biology than any lack of enthusiasm, creativity or hard work.

Synthetic biology aims to merge engineering approaches with biology. Researchers working at the most basic level are copying simple biological processes, such as the production of a protein from a gene. They break the process down into its component elements, such as a gene and the pieces of DNA and other molecules that control its activity. They then string these elements together to build a module they know will behave in a particular way — say, oscillate between producing and not producing a protein, or produce a protein that can switch another module on or off.

It is these kinds of components — oscillators and switches — that engineers order from suppliers and link together to build more complex electronic circuits and machines. Synthetic biologists are trying to develop a similar array of biological components, dubbed BioBricks, that can be inserted into any genetic circuit to carry out a particular function. Scientists at MIT have established a Registry of Standard Biological Parts, a catalogue of BioBricks that theoretically

Bidding for glory: teams from the ETH Zurich (top), Cambridge, UK, (bottom right) and Massachusetts at the first international Intercollegiate Genetically Engineered Machine competition.

selection of designs. Students from the University of Cambridge, UK, tried to make a circuit that could control the movement of *Escherichia coli* bacteria. They aimed to engineer the bacteria to contain a switch governing their sensitivity to the sugar maltose. With the switch off, the microbes would ignore the sugar. Tipping

the switch on would cause the bacteria to move toward the sugar.

Competition was fierce. MIT students

BRIEF COMMUNICATIONS

Engineering *Escherichia coli* to see light

These smart bacteria 'photograph' a light pattern as a high-definition chemical image.

We have designed a bacterial system that is switched between dormant states by red light. The system consists of a synthetic sensor kinase that allows a lawn of bacteria to function as a biological film, such that the projection of a pattern of light on to the bacteria produces a high-definition (about 100 megapixels per square inch), two-dimensional chemical image. This spatial control of bacterial gene expression could be used to 'print' complex biological materials, for example, and to investigate signalling pathways through precise spatial and temporal control of their phosphorylation state.

Plants and some bacteria use a class of protein photoreceptors known as phytochromes to control photomorphogenesis and the production of protective pigments¹. Photoreceptors are not found in eukaryotes, such as *Escherichia coli*, so we created a light sensor that functions in *E. coli* by engineering a chimera that uses a phytochrome from a cyanobacterium.

A phytochrome is a two-component system that consists of a membrane-bound, extracellular sensor that responds to light and an intracellular response-regulator². The response-regulator of most phytochromes do not have DNA-binding domains and do not directly regulate gene expression, so we fused a cyanobacterial photoreceptor to an *E. coli* intracellular histidine kinase domain (Fig. 1a, and see supplementary information). This design was based on the well-studied *E. coli* EnvZ-OmpR two-component system, which normally regulates porins expressed in response to osmotic shock³. The EnvZ histidine kinase domain has been used for the construction of functional chimeras^{4,5}, and a plant phytochrome has

Figure 1 Light imaging by using red fluorescent cells. **a**, The chromatic light receptor Cph1 contains the photoreceptor from *C. glutamicum* and the histidine kinase and response-regulator from *EnvZ*-OmpR (for simplicity, conversion of histidine to phosphohistidine (P-His), which forms part of the photoreceptor). Red light drives the sensor to a state which strongly phosphorylates its intracellular domain, turning off gene expression. For details of genes, see text. **b**, Miller assay showing that Cph1 is activated by red light (red bar) in the presence of P-His and inactive in the light (white bar). There is no light-dependent activity in the absence of Cph1 (—). **c**, **d**, **e**, **f**, **g**, **h**, **i**, **j**, **k**, **l**, **m**, **n**, **o**, **p**, **q**, **r**, **s**, **t**, **u**, enzymatically produces a black compound. The part of the photoreceptor that responds to light, phytochrome, is not naturally produced in *E. coli*. We therefore introduced two phytochrome-like dihydroxy ketone (DHK) and phytochrome from *Synechocystis* but converted them into phytochrome-like (parts 1, 1150A, 1150B, MIT Registry of Standard Biological Parts) (Fig. 1a, inset). Individual Cph1-EnvZ chimera were then fused at 37 °C for 4 h with broad-spectrum light and assayed for expression of lacZ reporter. The chimera Cph1-1150B produced a particularly strong response to light (Fig. 1b).

For bacterial photography, we grew a lawn of bacteria on agar. The lacZ reporter was activated by addition of 5-gal (5,4-cyanohepta-2,6-diene-3- β -D-galactopyranoside). LacZ types the formation of a stable, insoluble, X precipitate from 5-gal. Light exposed a response in the bacteria, giving a

biological film, in response to light and to the lacZ reporter. The lacZ activity shows that the light response is to be spatially and temporally controlled. The lacZ reporter is a potential application in photography, manufacture of computer and the signalling network.

Alexander Lendvai, Anne J. Silver, Zachary Smith, Lawrence, Matthew Lowy, Alexander Serebriy, and Edward M. Serebriy, *E. coli*

Genetic 'Jamboree' draws innovators

Science students the world over share research

At MIT's International Genetically Engineered Machine Competition yesterday, the audience listened to a presentation on synthetic biology. (John Tlumacki/Globe Staff)

U of A team building a better bacterium

By [Ileiren Poon](#), ExpressNews Staff

October 22, 2007 -
Edmonton - A group of
University of Alberta
students have spent
the summer working
on building a new kind
of bacteria - one that
might hold some
answers to the
planet's diminishing
supply of fossil fuels.

The team members -
who call themselves
the Buta-nerds - have
been working on a
way to create an organism that will produce
butanol fuel for an annual competition hosted by

Members of the U of A
Buta-nerds team are
collecting data for a Nov.
competition at MIT.

BERKELEY CENTER FOR SYNTHETIC BIOLOGY

A JOINT PROGRAM OF THE CALIFORNIA INSTITUTE FOR QUANTITATIVE BIOMEDICAL RESEARCH (QB3)
AND LAWRENCE BERKELEY NATIONAL LABORATORY (LBNL)

The California Institute for Quantitative Biomedical Research (QB3) and Lawrence Berkeley National Laboratory (LBNL) have joined forces to accelerate the growth of synthetic biology, a new field that promises major new advances in preventing and treating disease, generating new energy sources, and preventing and mitigating environmental threats.

Opening in spring 2005 in a spacious, modern building in west Berkeley, the Berkeley Center for Synthetic Biology gives renowned scientists and engineers the chance to pool their talents and collaborate in new ways, with enormous potential benefits for California's citizens in the form of advances in biomedicine and energy renewables and economic growth.

Synthetic biologists study the control and design of biological components and new organisms to solve a host of important health, energy, and environmental problems that cannot be solved using naturally occurring biological entities. The inherently

QB3 and LBNL scientists occupy lab space in a building renovated in 1997 for biotech research, previously leased by Bayer, featuring large labs, viral suites, and tissue culture rooms. UCSF Mission Bay and numerous biotech firms are nearby.

MIT establishes groundbreaking biological engineering major

February 17, 2005

The Massachusetts Institute of Technology faculty yesterday approved a new course of study for undergraduates, in biological engineering, the first entirely new curriculum established at the Institute in 29 years.

ALEC AND SHANNA
STARRING IN

THE COMPUTER TRAP

COMPLIMENTS OF Radio Shack
The Name in Classroom Computing

THAT'S RIGHT, ALEC! SCRIPTSIT IS A WORD PROCESSING PROGRAM. MY DAD HAS A TRS-80 MODEL 12 COMPUTER WITH SCRIPTSIT IN HIS OFFICE... AND HE TAUGHT ME HOW TO USE IT WITH A DAISY WHEEL PRINTER...

...TO WRITE BUSINESS LETTERS, RESEARCH NOTES, PRESS RELEASES, AND BULLETINS.

SHANNA YOU KNOW SO MUCH - SHOW US HOW...

...SCRIPTSIT WORD PROCESSING WORKS IN OUR SCHOOL'S OFFICE.

IN THE SCHOOL OFFICE...

TURN ON THE POWER SWITCH THEN "INSERT DISKETTE" APPEARS ON THE SCREEN... CAREFULLY PUSH DISKETTE INTO THE SLOT (DRIVE 0) AND ROTATE THE LATCH TO A HORIZONTAL POSITION.

DRIVE 0
DRIVE 1

AFTER THAT THE WORD "INITIALIZING" APPEARS WHICH MEANS THE COMPUTER IS LOADING THE PROGRAM...

INITIALIZING

AFTER THE LIGHT GOES OUT, THE PROGRAM HAS BEEN "LOADED" INTO THE COMPUTER. NEXT, THE COMPUTER TELLS YOU TO TYPE IN THE DATE...

...FOR EXAMPLE APRIL 6, 1984, TYPE 04/06/1984 AND THEN PRESS THE **ENTER** KEY.

ENTER DATE (MM/DD/YYYY)

NEXT, THE COMPUTER PROMPTS YOU TO ENTER THE TIME USING THE 24-HOUR SYSTEM, GIVING HOURS, MINUTES AND SECONDS.

FOR EXAMPLE 9:30 AND 20 SECONDS A.M., TYPE THIS WAY-- 09.30.20. AND THEN PRESS THE **ENTER** KEY.

ENTER TIME (HH. MM. SS)

...ALSO, THE SMALL RED LIGHT NEXT TO THE DISK DOOR WILL BE "ON"!

THAT MAKES THE "DIRECTORY" APPEAR ON THE SCREEN. THE DIRECTORY IS DIVIDED INTO SIX "CELLS". EACH CELL IS THE STORAGE UNIT FOR INFORMATION ABOUT ONE DOCUMENT...

NAME	DATE	TIME	STATUS	LENGTH	BYTES	DISK
SCRIPTSIT	04/06/1984	09:30:20	OK	1000	1000	1
SCRIPTSIT	04/06/1984	09:30:20	OK	1000	1000	1
SCRIPTSIT	04/06/1984	09:30:20	OK	1000	1000	1
SCRIPTSIT	04/06/1984	09:30:20	OK	1000	1000	1
SCRIPTSIT	04/06/1984	09:30:20	OK	1000	1000	1
SCRIPTSIT	04/06/1984	09:30:20	OK	1000	1000	1

...AND IN TURN, A DOCUMENT CAN BE MADE UP OF SEVERAL PAGES OF INFORMATION.

IS THERE A SCRIPTSIT PROGRAM FOR OUR CLASSROOM TRS-80 MODEL 4'S?

YES, THERE IS A SPECIAL SCRIPTSIT PROGRAM FOR THE MODEL 4'S!

ADVENTURES IN SYNTHETIC BIOLOGY

STORY: DREW ENDY ISADORA DEESE
THE MIT SYNTHETIC BIOLOGY WORKING GROUP
ART: CHUCK WADEY WWW.CHUCKWADEY.COM

ENGINEERED GENETIC DEVICES

LET ME INTRODUCE YOU TO A FRIEND OF MINE. IT'S CALLED AN INVERTER DEVICE.

IT COULD BE THE ANSWER YOU'RE LOOKING FOR.

SEE, THANKS FOR TELLING ME AHEAD OF TIME!

WHAT THE HECK IS AN INVERTER?!

I KNOW BACTERIA BALLOONS COULD WORK—
—IF ONLY THERE WAS SOME WAY TO STOP THEM FROM GROWING UNTIL THEY EXPLODE!

OK, PAY ATTENTION! AN INVERTER IS A COMBINATION OF BASIC DNA PARTS THAT—

—WORKING TOGETHER, TURN SOMETHING UPSIDE DOWN.

ON BECOMES OFF, LOW BECOMES HIGH, AND SO ON.

YOU'D PREFER THING—ANALOGY?

IT'S ENOUGH YOU'RE A KNOW-IT-ALL, YOU DON'T HAVE TO RUB IT IN.

WE CALL AN INVERTER A DEVICE IN ORDER TO HIDE ALL THE DETAILS OF HOW IT WORKS.

FOR EXAMPLE, HERE'S SOME DNA CODE—

—NOW YOU TELL ME WHAT IT DOES!

HEY! WATCH IT!

I HAVE NO IDEA, OK? WHAT IS IT?

DON'T FEEL BAD. MY POINT IS, YOU SHOULDN'T HAVE TO MEMORIZE EVERY LAST PIECE OF DNA.

WE'RE GOING TO HIDE ALL THESE DETAILS INSIDE THE DEVICE.

PHEN—

HOW DID YOU DO THAT?

Parts of an Inverter

1. **Ribosome Binding Site (RBS)** - Basic elements that start the process of protein synthesis.
2. **Repressor** - A gene that encodes a particular type of protein that will bind DNA sites in a specific Operator part and cause changes in the rate of gene expression.
3. **Terminator** - Special elements that decrease the flow of RNA polymerase along DNA, sometimes to zero!
4. **Operator** - Stretches of DNA that contain Repressor protein binding sites and RNA polymerase binding and initiation sites. With a Repressor protein, the Operator part will be turned OFF. Without a Repressor protein, the Operator part will be turned ON, allowing RNA polymerase to bind and initiate a HIGH output signal.

YOU COULD HAVE USED AN INVERTER DEVICE TO HELP PREVENT BUDDY'S UNFORTUNATE ACCIDENT.

Is it a boy or girl?

Ooey, Gooley, DNA!

Solve the chromosome puzzle.

Dress up for sterile techniques.

Quality time, quality learning, quality play.

Looking forward

Source: Bio era

Driving Forces

- Rapid advance of DNA sequencing, synthesis, and other enabling technologies
- Global growth of biotech R&D, knowledge, and applications
- Geopolitics; new security concerns
- Energy prices and climate change
- Urbanization and industrialization in developing economies

Major Uncertainties

- How quickly will biological engineering advance?
- Will governments attempt to restrict access to advanced biotech tools?
- How will public attitudes toward biological engineering evolve?
- Will the assertion of intellectual property rights slow innovation in synthetic biology?
- Will terrorists or governments use genome engineering techniques to create biological weapons?

Predetermined Elements

- Increasing environmental stress on global ecosystems
- Growing infectious disease threats to human and animal populations
- Human curiosity & technical innovation
- Growing healthcare needs of aging populations

Prime Movers

- U.S. government: DOE, NIH, NSABB, USPTO
- Biological engineering researchers
- “Open source” biology community
- Bioterrorists
- Energy, chemical, and pharmaceutical industries

Welcome

Amyris Biotechnologies is translating the promise of synthetic biology into solutions for real-world problems. Building on advances in molecular, cell and systems biology, we are engineering microbes capable of producing high-value compounds to address major global health and energy challenges. We are employing these living chemical factories to produce novel pharmaceuticals, renewable fuels, and specialty chemicals.

Investors

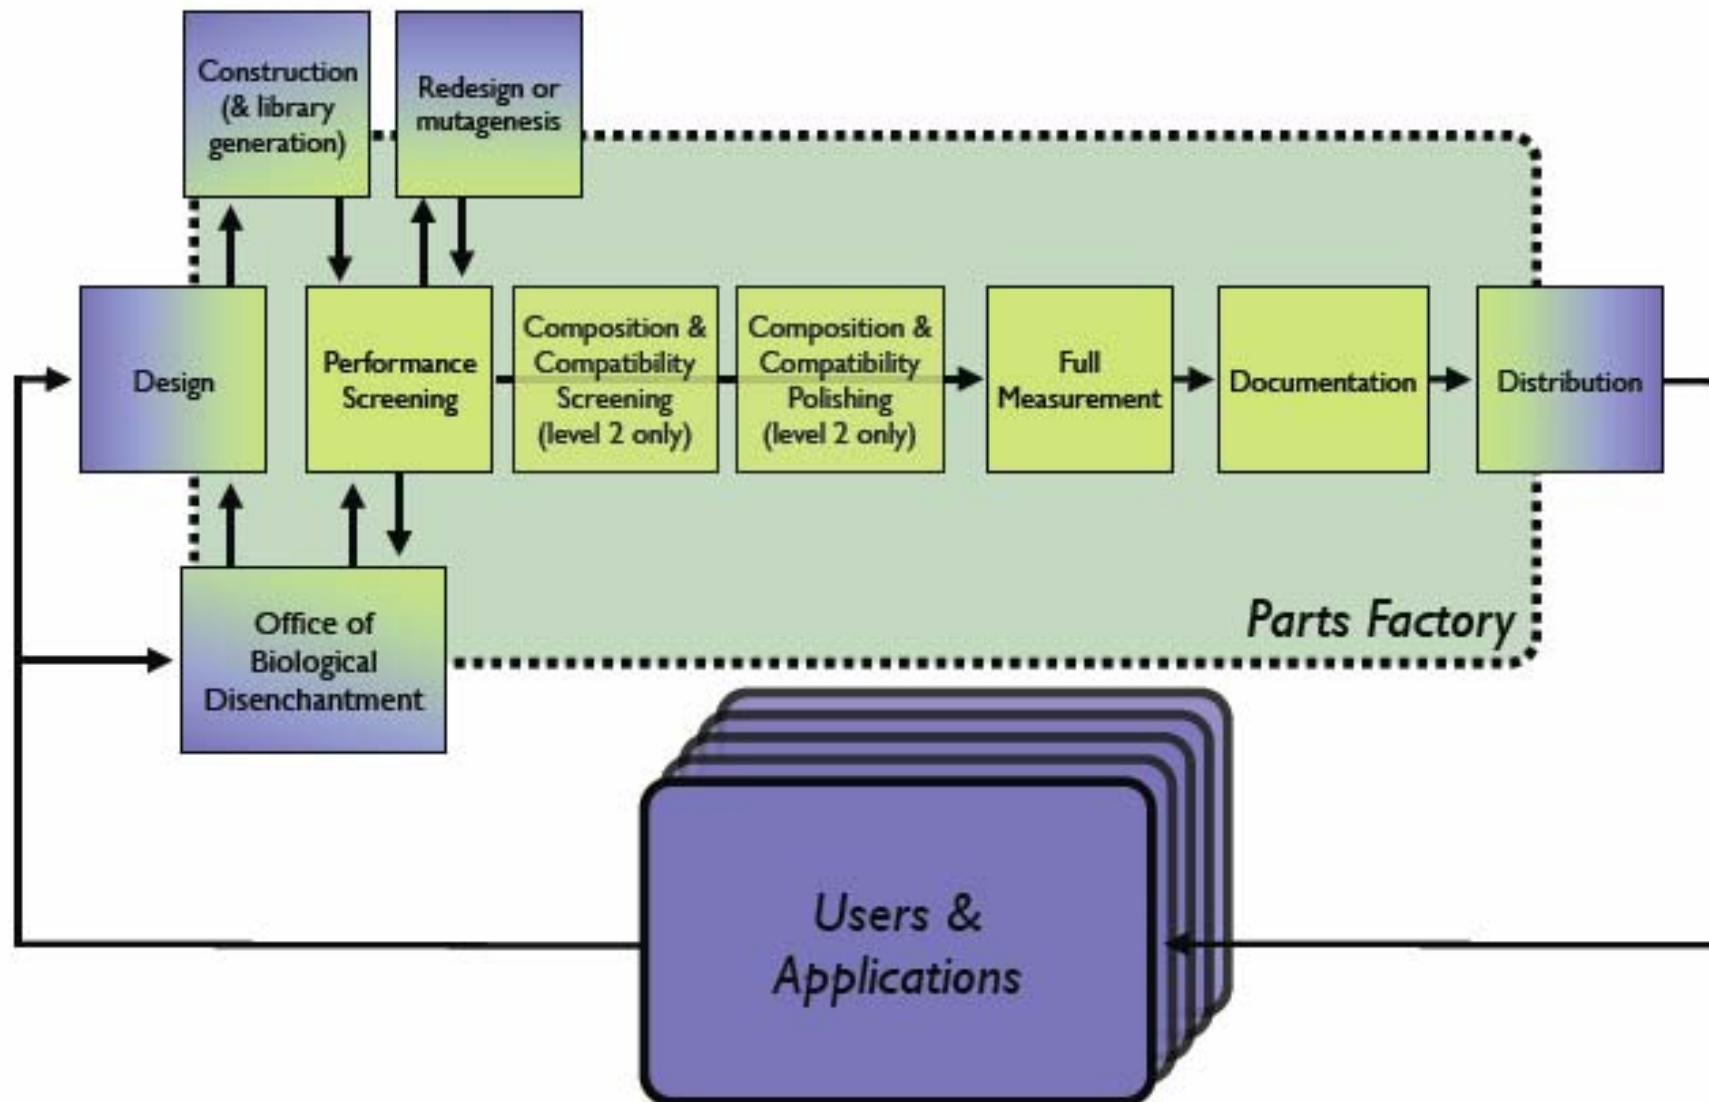

Funded by a syndicate of well-respected, top-tier venture capital firms, Archemix has raised over \$100 million to date.

The Series B round (\$53M, completed 1Q 2004) was led by Highland Capital Partners, and included all of the Series A investors and Athenian Venture Partners.

The Series A round (\$52M, completed 3Q 2002) included lead investors Atlas Venture, Prospect Venture Partners and SV Life Sciences. Other investors included Rho Ventures, Care Capital, MDS Capital, POSCO BioVentures, and US Trust Private Equity.

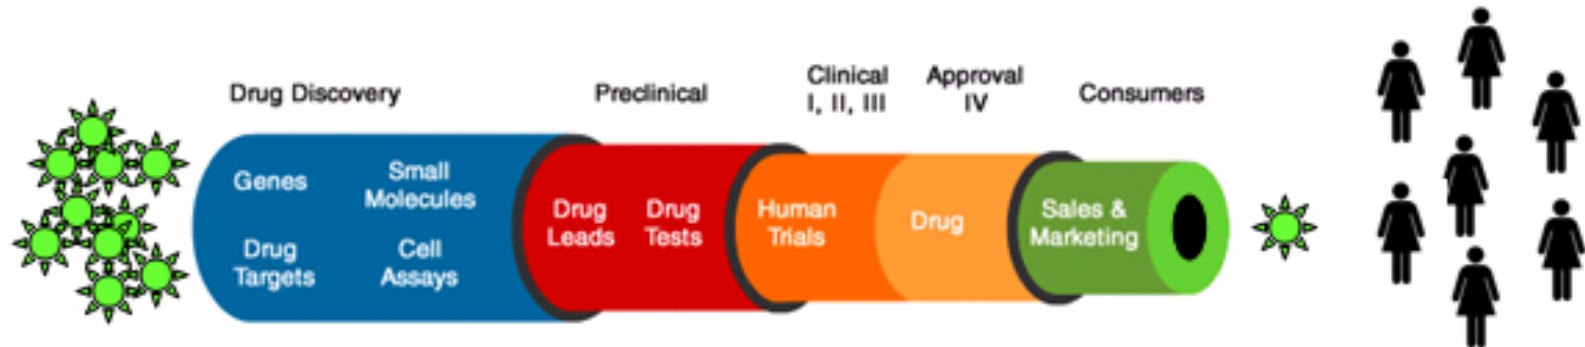

Archemix and Merck KGaA Sign Strategic Alliance

Collaboration to Focus Primarily on Cancer Therapeutics Using Novel Aptamer Technology

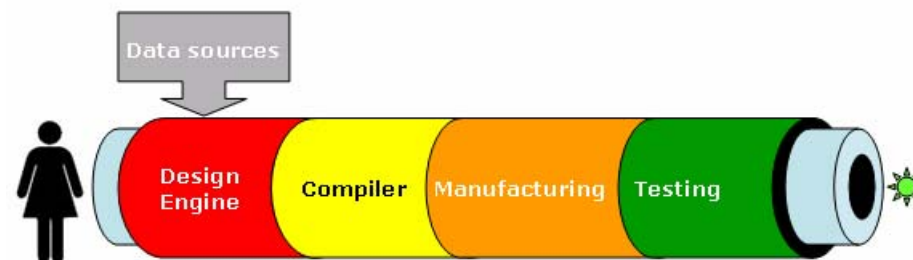

Toward a New Drug Development Pipeline Suitable for Personalized Cancer Therapeutics

Ideally, a next-generation pipeline for effective cancer drugs would:

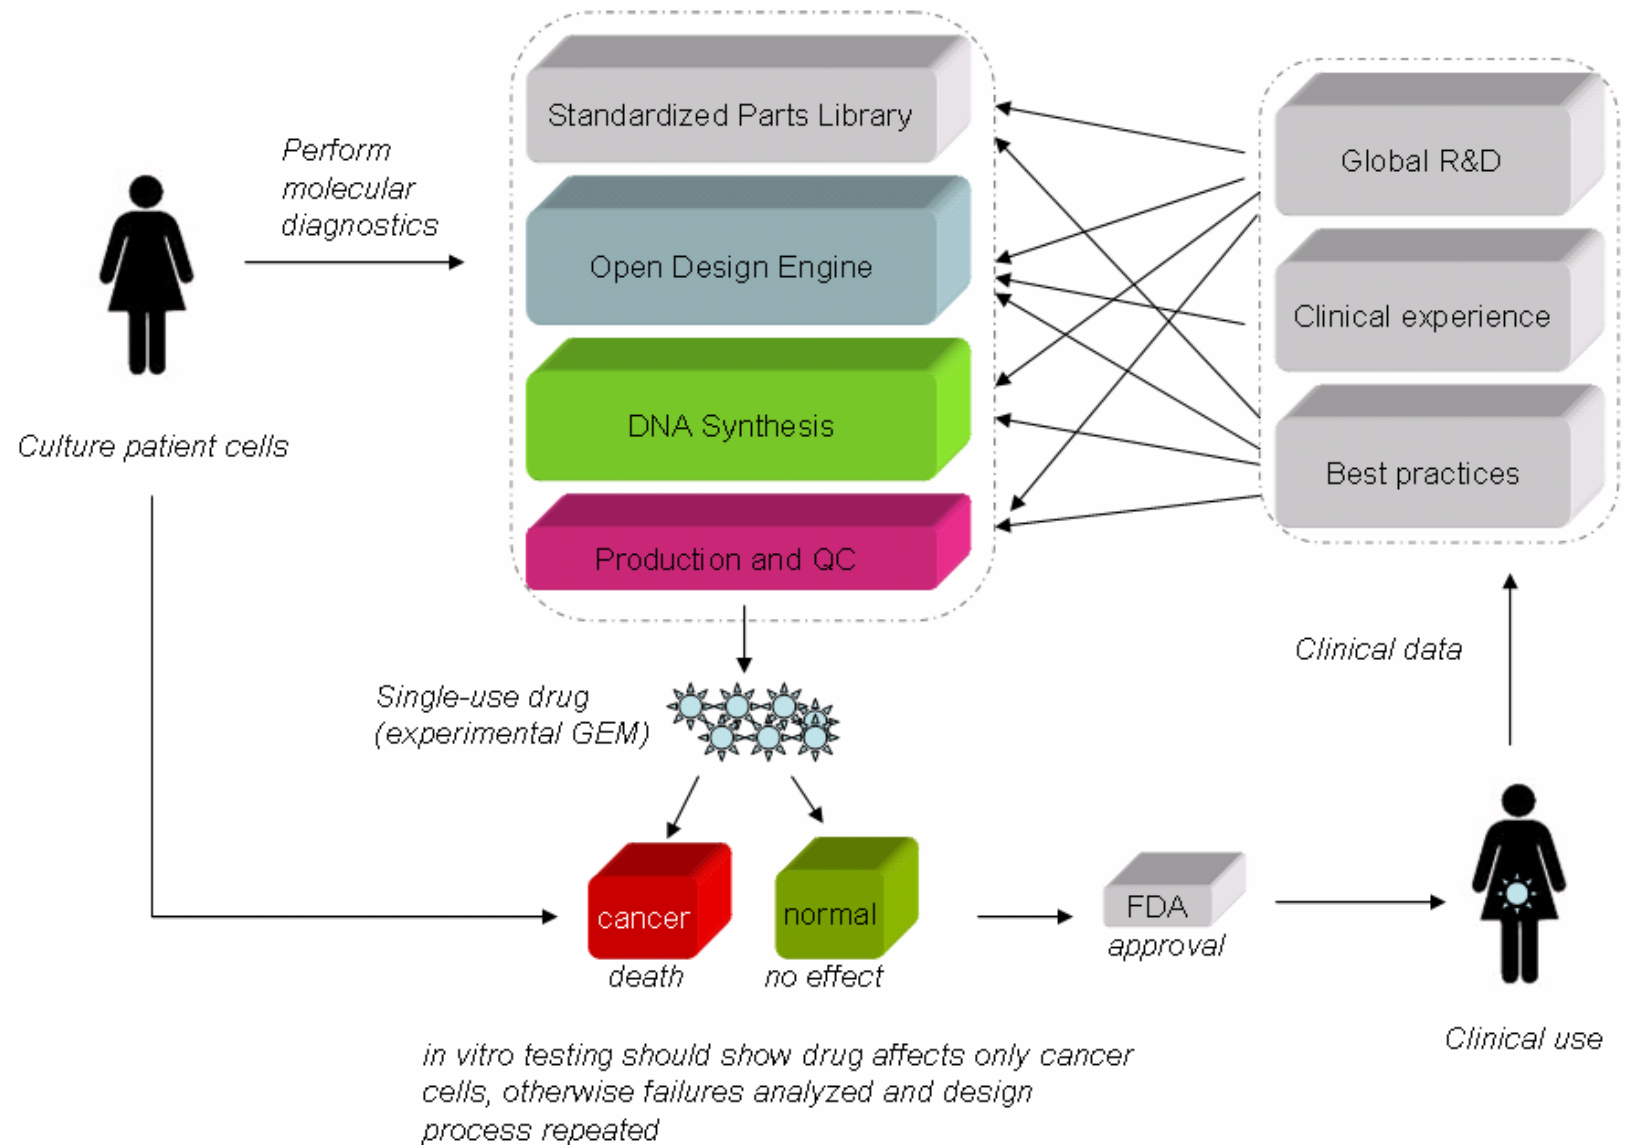

- As an output, produce personalized medicines
- Be able to produce a targeted medicine for every cancer, newly diagnosed or recurring
- Allow for rapid and sustainable development of these outputs
- Have favorable drug development economics, ie. the cost of producing drugs decreases over time
- Make a failure of any drug in the pipeline a trivial event
- Be able to grow in output capacity to satisfy the needs of a global market
- Continuously incorporate the latest understanding and data from molecular biology, oncology, and related sciences, plus growing clinical experience with personalized medicines
- And, finally, ensure the highest possible standards of safety and oversight

Google Health Wants to Digitize Your Medical Records

Google Health, Mayer says, wants to digitize your health records—x-rays, immunization records, every surgery, every doctor visit, everything. And she wants you to be able to take it with you anywhere in the world, perhaps on some kind of external device. That information will be protected by a password, but you will also be able to share it with your friends and family.
